

Subsea Hydraulic Power Units – SHPUs Buyers guide – Version 1.4

Content

- Subsea HPUs in general
- Seatools SHPU offerings
 - Standardized SHPUs
 - Custom SHPUs
 - Subsea electro-hydraulic drive train elements & solutions
 - In need for a SHPU?

Subsea HPUs in general

Purpose, applications, and considerations

Why use SHPUs?

- Obviously because hydraulic power is required for a subsea actuator (valve, cylinder, thruster etc.)
- Often alternative to direct hydraulic power via hydraulic umbilical from surface
- Advantages electro-hydraulic configuration via SHPU:
 - Eliminates burden of hydraulic hose handling
 - Improved efficiency. In a surface HPU configuration, hydraulic hose losses can easily reach 25%
 - Minimization of system latency. Of particular importance for e.g. dredging process control or subsea vehicle DP
 - Reducing chance of oil spillage
 - Sometimes it is the only option, e.g.:
 - Depth is too great for direct hydraulic
 - Electric actuator not available

Advantage SHPU – Umbilical handling

Example: 40 kW of subsea hydraulic power required for cylinder actuation

Umbilical comparison		
Configuration	Direct hydraulic	Electro-hydraulic
Umbilical type	Optic-electric- hydraulic	Optic-electric
Required hydraulic power	40 kW	
Umbilical Ø	Ø 120 mm	Ø 30 mm
Umbilical weight	13000 kg/km	1450 kg/km
Umbilical MBR	1200 mm	295 mm

Hydraulic umbilical handling more difficult, especially in current conditions (catenary)

- Far larger umbilical reel required, with higher installed power (for CT function)
- Forces on tool can become significant, with tool positioning difficulties as a result

Differences with surface HPU

- Marinization of subsea hydraulic systems is not a straightforward matter
- Amongst many other aspects the following should be considered:
 - Pressure compensation
 - Reservoir design
 - Marine growth
 - Hyperbaric effect on hydraulic oil
 - Material selection
 - Intervention & maintainability
 - Dynamic seal design
 - Permeability of dynamic barriers
 - Connectors
 - Furthermore, typical reliability levels of subsea HPUs need to be higher than surface HPUs because subsea HPUs are often used at remote locations, harsh environments, and involve high OPEX operations

Seatools SHPUs

And related drive train elements

Seatools SHPU solutions

Standardized SHPU solutions

Custom SHPU solutions

Electro-hydraulic drive train solutions

Standardized SHPU range

Benefits

- Short lead times
- Plug & play units
- Customization
- Customization
 - For each unit flow & pressure range
 - The basic configuration of the subsea HPU can be further complemented with a range of components and auxiliary systems
 - Example applications
 - Dredging components (e.g. suction arm) & tools
 - Subsea installation tools
 - Subsea valve actuation

Standardized SHPU range (2)

Product sheet contents:

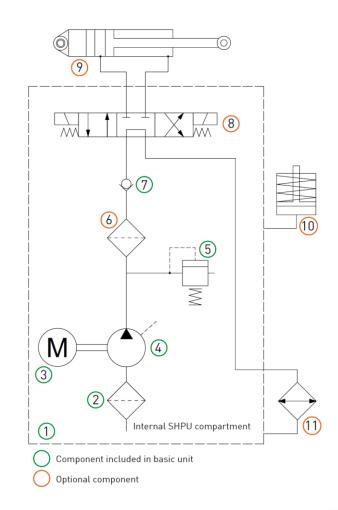

- Detailed hydraulic, electric & mechanical specifications
- Configurational items
- Optional items

Standardized SHPUs – constituents

- Basic configuration includes:
 - Housing / fixed volume oil reservoir (1)
 - Suction filter (2)
 - Electric motor (3)
 - Hydraulic pump (4)
 - Overpressure relief valve (5)
 - Check valve (7)
 - Piping
 - Sensors (water ingress, E-motor temp.)
 - Hydraulic and electric connectors
- Optional items:
 - External box cooler (11)
 - Subsea pressure compensator / reservoir (10)
 - Pressure filter (6)
 - Hydraulic consumers (9)
 - Control components (8)
 - Instrumentation

SEATOOLS 18-3-2024

Custom made SHPUs

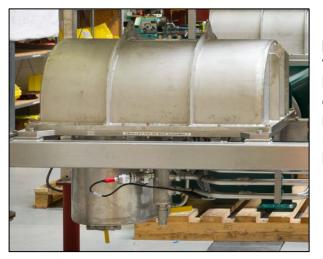

Benefits

- A suitable SHPU for every application
- Plug & play units
- One-stop shop
- Extensive track record
 - Water depth rating: 0 6000 msw
 - Power rating: 0.1 450 kW
 - Supply voltage: Up to 6 kV
 - Shock loads: Up to 15G, 5 ms
 - E-motor types: AC/DC and servo
 - Battery powered

▲ Small sized, 0.2 kW SHPU. This custom designed and build SHPU is battery powered and has a depth rating of 3500 msw.

Custom made SHPUs – Examples

◄ SHPU at which the powerpack is combined with a number of other hydraulic and electric components. Smart modularization allows for (cost-) efficient subsea hydraulic system designs.

Modular 225 kW
SHPU unit with 7
pump units. This
SHPU, with an open
pump housing
configuration, also
features integrated
cooling means.

▲ Duo 120 kW, subsea hydraulic powerpacks in a closed pump housing configuration.

Electro-hydraulic drive train elements

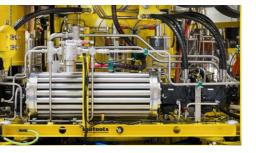

- Next to SHPUs, Seatools supplies auxiliary components and sub-systems of the subsea drive system
- This ranges from components such as
 - <u>Compensators & reservoirs</u>
 - Subsea sensors
 - to sub-systems such as
 - Controls
 - Umbilical winches
- In fact, Seatools can deliver the entire subsea drive train from control panel to actuator

Seatools' subsea reservoirs with capacities from 0.6 (I) to 1000+ liters (r)

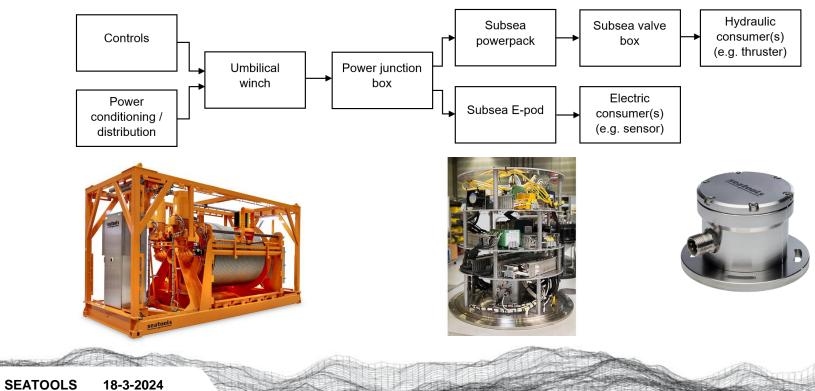

Typical subsea drive train

In need for a SHPU?

In need for a SHPU?

Seatools gladly assist you with finding an optimal SHPU solution

- As a starting point, the following basic information is useful to assess your case and advice on a potential SHPU solution:
 - Functional requirements
 - Required pressure & flow rate
 - Number and type of hydraulic consumers
 - Operational requirements
 - Depth rating
 - Type of hydraulic fluid
 - Operational temperature limits
 - System integration:
 - Available power supply
 - Mechanical integration limitations
 - Impression of remaining hydraulic circuit & modularization
 - General:
 - Desired scope of supply (i.e. single SHPU or other drive train elements)
 - Required delivery time
- Based on this information, Seatools drafts an initial hydraulic diagram to facilitate further discussions on potential solutions
